

# Why raw-scale RMSE cannot compare coefficients ( $R^2 = 0.5$ , $\epsilon = 1$ , $n = 10,000$ )

Same estimates in all three panels. Raw  $RMSE_j = y\_sd \cdot RMSE\_j(std)/s\_j$ , so it tracks the units of  $x\_j$  (income in dollars vs a 0/1 flag), not estimation quality.
